

Gabriel Chapel  
Advanced Mobile App. Dev.  
Grad Project  
Milestone 1

This project will be an extension of my first project for the class, where I allowed a user to record multiple audio files and play them at the same time. For this project, though, I will improve the user experience by allowing the addition and removal of tracks. In addition to this improvement, I will also make sure that the tracks loop properly and that the saved data is persistent, features that were unsuccessful in my first project. I may have to pursue a different framework other than AVFoundation to accomplish this as well as incorporate a collection view. The user interface will remain nearly the same, but with an add button included on the recording tab, as shown below. The tab containing the saved recordings will be the same as before.
